

Delivery Sprint-2

Industry-Specific Intelligent Fire Management System

TEAM ID: PNT2022TMID45189

Create a smart fire management system that includes a Gas sensor, Flame sensor and temperature sensors to detect any changes in the environment. Based on the temperature readings and if any Gases are present the exhaust fans are powered ON. If any flame is detected the sprinklers will be switched on automatically. Emergency alerts are notified to the authorities and Fire station.

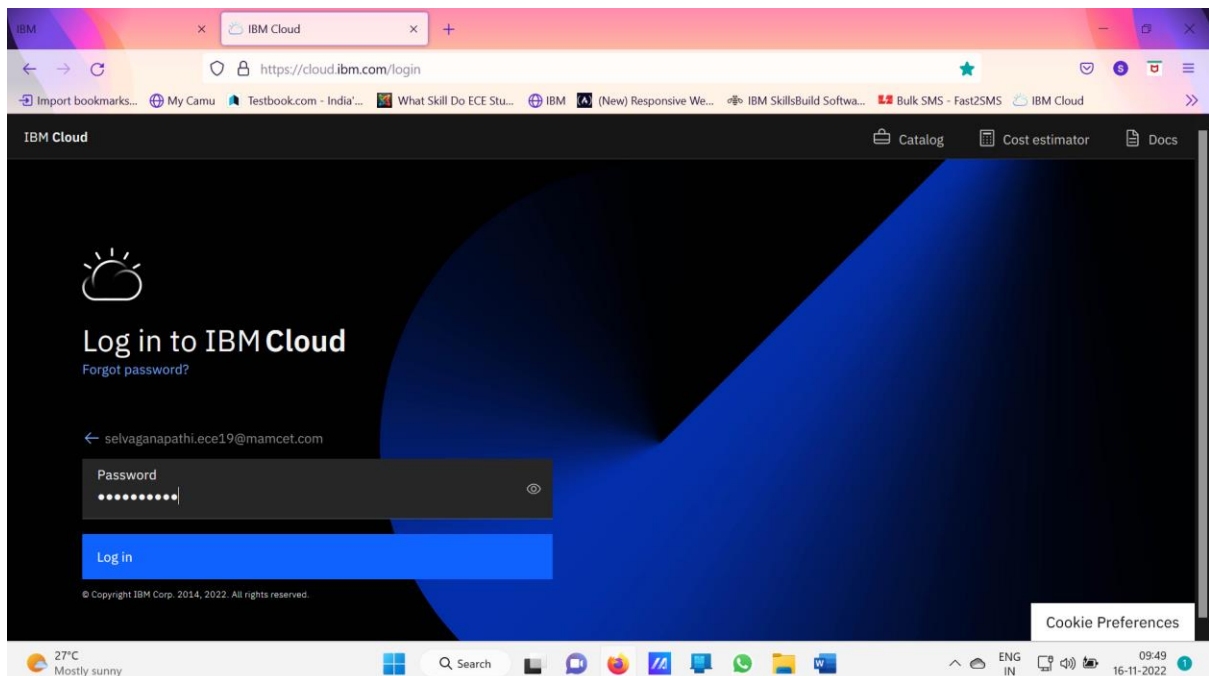

Sprint-2

Software (Create device in the IoT Watson platform, workflow for IoT scenarios using Node-Red)

STEPS

- 1) Create a IBM Cloud account using the instructions given by tutorial instructors / watching the manual in the Drive Documents.
- 2) Then Login to the IBM Cloud and it open to the Dashboard.
- 3) Create a IoT Service and save the individual credential shown in the display.
- 4) Launch the IBM IoT Watson Platform and Create a new device and save the credential for future references.
- 5) Add new device and code the program for the module / project and save it.
- 6) Finally Simulate using the device simulator and create the board to show the data's in output of the eventflow.
- 7) Then create a Node-Red flow using the required credential like shown in the tutorial as a reference.
- 8) Connect the Node-Red with IBM IoT Watson with the required API Key information and deploy the Node-Red for the Data to show.

ASK A QUESTION

Node-RED on IBM Cloud

Node-RED

Flow-based programming for the Internet of Things

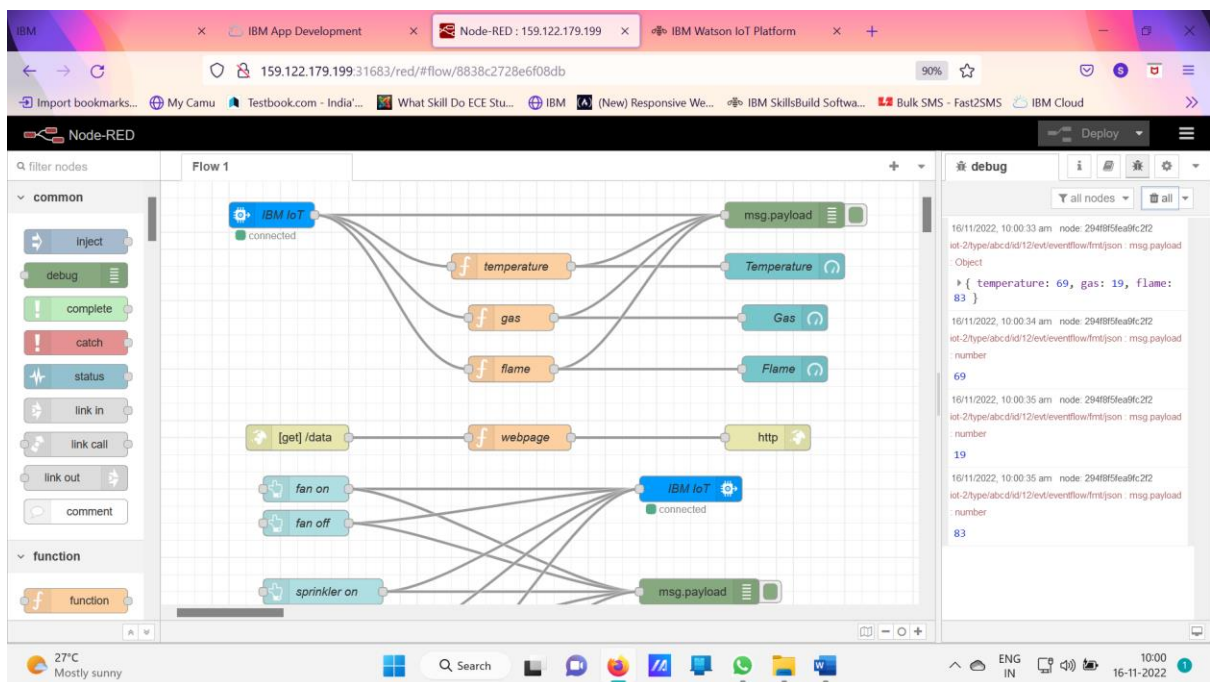

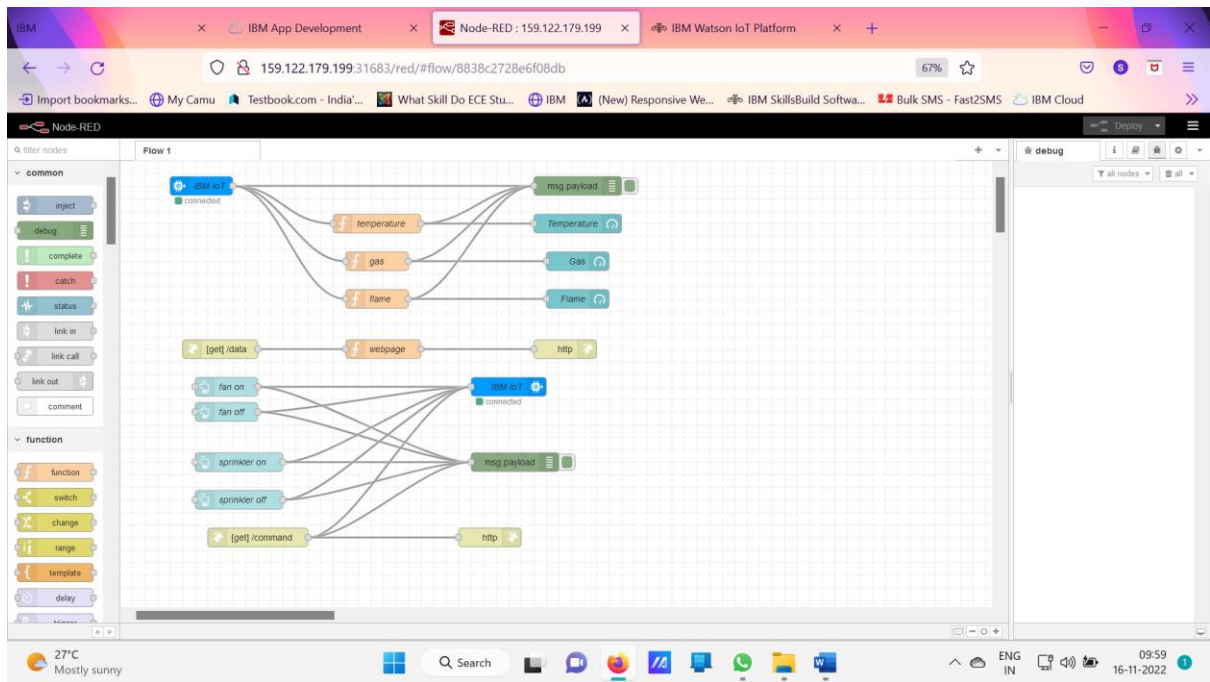

Node-RED is a programming tool for wiring together hardware devices, APIs and online services in new and interesting ways.

This instance is running as an IBM Cloud application, giving it access to the wide range of services available on the platform.

More information about Node-RED, including documentation, can be found at nodered.org.

[Go to your Node-RED flow editor](#)

[Learn how to customise Node-RED](#)

Node-RED interface showing a flow for monitoring a fire system. The flow starts with an IBM IoT node (connected) which triggers a function node. This function node branches into three parallel paths: temperature, gas, and flame. Each path contains a function node (temperature, gas, flame) and a corresponding output node (Temperature, Gas, Flame). The flow then branches into two parallel paths: fan on/off and sprinkler on. Each path contains a function node (fan on, fan off, sprinkler on) and a corresponding output node (fan on, fan off, sprinkler on). The flow ends with a msg.payload node.

The right sidebar shows the debug console with the following messages:

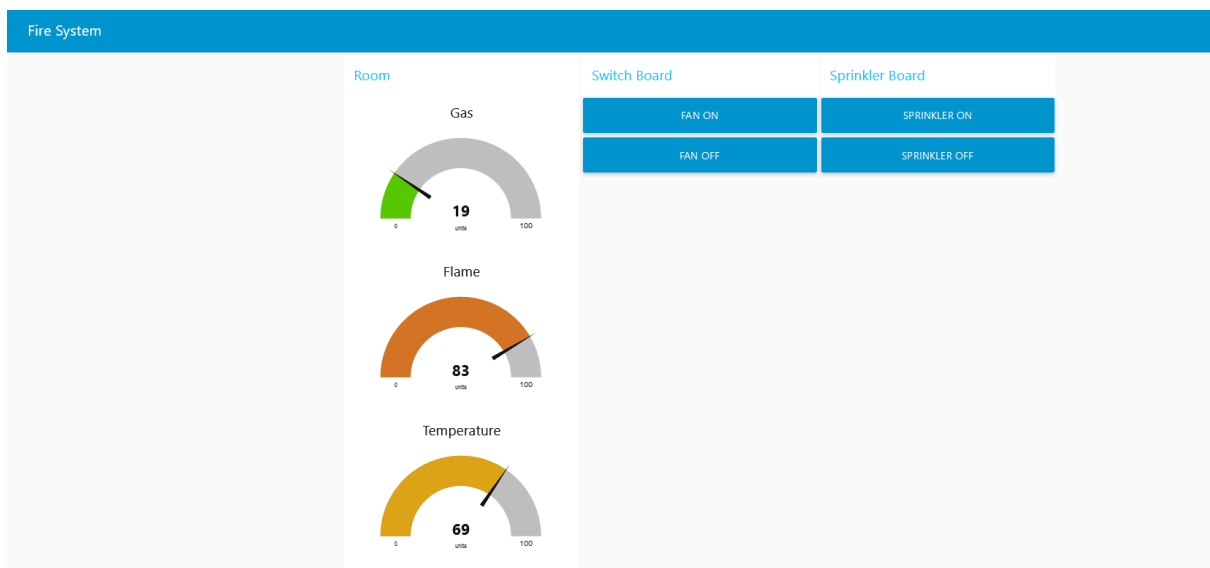

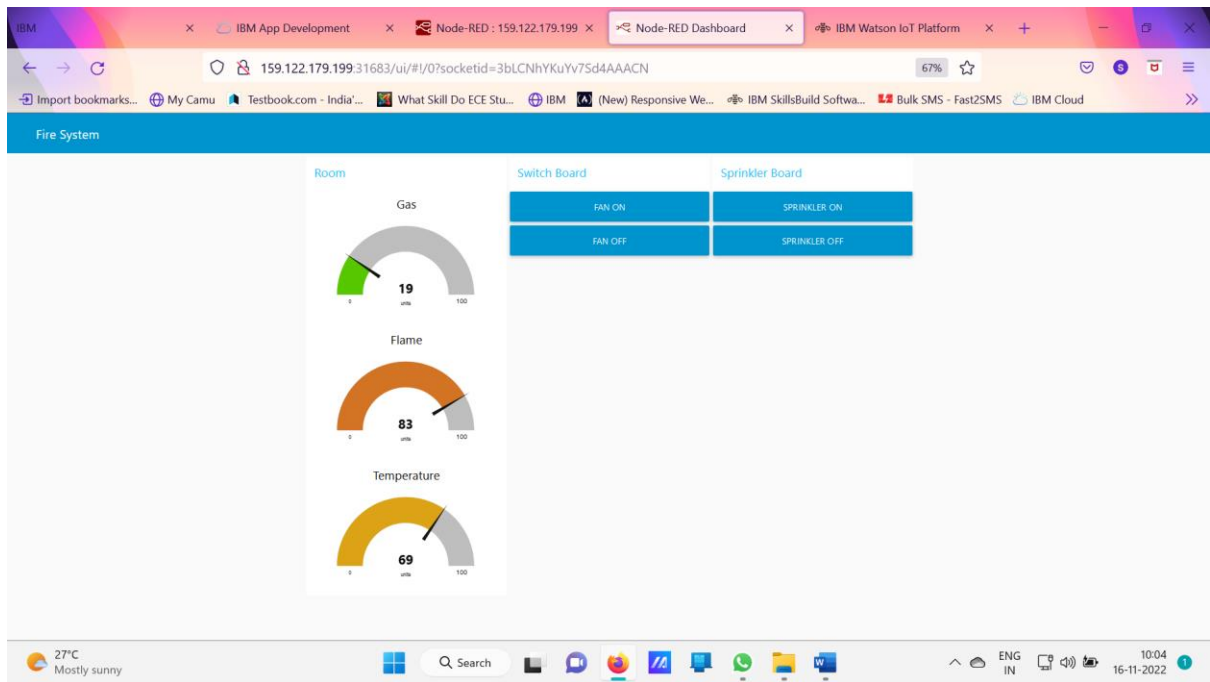

```
16/11/2022, 10:00:35 am node: 294895ea9fc202  
ist-2type/abcd  
Object  
{  
  temperature: 69  
}
```

The bottom status bar shows the system temperature as 27°C and the weather as Mostly sunny.

Node-RED interface showing the same flow as above, but with the dashboard sidebar open. The dashboard sidebar shows the following structure:

- Layout
- Site
- Theme
- Fire System
 - Room
 - Switch Board
 - Sprinkler Board

The bottom status bar shows the system temperature as 27°C and the weather as Mostly sunny.
